

Assignment 2 Case Study

Stage 2 Tutorial From Problems to Requirements

Week 5 | 60 minutes

Learning goals

- Analyse stakeholders.
- Distinguish functional and non-functional requirements.
- Recognise ambiguity and unsupported requirements.
- Define scope.
- Develop user stories and acceptance criteria.
- Critique AI-generated requirements.

Activity 1 - Stakeholder Map

Stakeholder	Need	Potential conflict
Clinic Staff	Easy appointment and information to manage	Maintaining accurate records
Practitioners	Accurate appointments and no double booking	Direct schedule access isn't confirmed
Patients	Accurate information	Data access requirements
Management	Need a small maintainable system	More features and keeping it simple

Activity 2 - Functional or Non-Functional?

- ☐ **Functional** ☐ Non-functional The system shall allow staff to cancel an appointment.
- ☐ Functional ☐ **Non-functional** The system should remain responsive for the course-scale dataset.
- ☐ **Functional** ☐ Non-functional The system shall retain cancelled appointments.
- ☐ Functional ☐ **Non-functional** Core business logic should be independently testable.
- ☐ **Functional** ☐ Non-functional The system shall search for a patient by ID.

Activity 3 - Repair Ambiguous Requirements

The system should be easy to use.

Problem: Not measurable Clarification question: What requirements do staff need to complete tasks easily?

Patient search should be fast.

Problem: Not measurable Clarification question: What is a reasonable response time for patient searches?

The system should securely manage data.

Problem: Lacks clarity Clarification question: What security issues need to be addressed?

Appointments should normally be easy to cancel.

Problem: Ambiguous Clarification question: What cancellation rules should be applied and who is allowed to cancel appointments?

Activity 4 - AI Requirements Audit

Classify each suggestion: Confirmed / Assumption requiring validation / Unsupported / Out of scope.

AI suggestion	Classification	Evidence / reason
Patients receive SMS reminders.	Unsupported	Not mentioned
Facial recognition login.	Out of scope.	Not for a simple software system
Receptionists create appointments.	Assumption requiring validation.	Staff manage the bookings but isn't confirmed on the exact role
Online payment.	Out of scope	Not part of it
Practitioners view schedules.	Assumption requiring validation.	Schedule viewing isn't explicitly stated
AI recommends treatments.	Out of scope.	The system is for the patients and staff
Cancelled appointments remain in history.	Confirmed.	It is a requirement example

Exit question

Why is 'AI suggested it' not sufficient evidence for a requirement?

It is not sufficient as it can give features that were never requested by stakeholders. And the requirements need evidence from the client brief, stakeholders and information given for the system to stay within the scope.
